

XSI Data Solutions

Organizations are challenged to manage more data, storing it according to its changing value as it ages and coming to terms with implementing comprehensive data protection strategies and management (Information Life Cycles).

New regulations on e-mail and document archives for business and regulatory compliance reasons, other areas such as near line data repositories, data staging, business continuance planning.

Backup and restore aspects of large amount of data have raise concerns about high bandwidth requirement of tape backup systems within a limited data management operational window and immediate recovery and restoration situations.

The ViperVault RAID system is the ideal solution to meet these new challenges facing data center managers for environments that require low cost storage, filling the price / performance gap between fast but costly primary storage and less costly but slower tape and optical storage. ViperVault can serve as a key component of a comprehensive storage infrastructure strategy.

Product Highlights

- Scalable from 3TB to 32TB
- Operating system & host independent
- Dual controllers configuration for high availability
- Advance & proven Viper RAID Architecture
